
(a) Bell in the upper half: P10, zBR
exact posterior (SMC)
its 3 weighted components
trained, $K = 3$
trained, $K = 1$
trained, truncated Gaussian
best possible single KS
density
stiffness factor z
(b) Cut by the bound $z = 1$: P0, zBL
density
stiffness factor z
(c) Piled against $z = 1$: P8, z4
density
stiffness factor z
(d) At the lower bound: P5, zBL
density
stiffness factor z
(e) Bells: a single KS cannot set its skewness
exact marginal
best possible single KS
skewness
mean of $u = (z - 0.45)/0.55$
(f) What each family can do at best
bell
cut by a bound
piled
KL gap to the best $K = 5$ mixture [nats/marginal]
$K = 1$
$K = 2$
$K = 3$
trunc. Gauss.
